

You can develop Raspberry Pi 3 projects in 32 bit mode using bare metal programming.

- Use the CCS (Code Composer Studio) to compile your project. We need an eclipse based ARM development environment and CCS can perform this task.
- Use the rasspi\_project\_template.zip project as your starting project. The starting project is a GPIO sample project containing the startup files and the linker script. Extract the zip file to a temporary directory and import it to CCS.

The compiler settings:

The RPI2 define must also be defined.

After compiled your project press the F11 key in TINA to assign the compiled project to the Raspberry Pi 3 MCU
